

TASKS:

1. Write the Git command for each: initialize a repo, stage all files, commit with a message, push to remote, pull latest changes.

Initialize a repository

`'git init'`

Stage all files

`'git add .'`

Commit with a message

`'git commit -m "Initial commit"'`

Push to remote repository

`'git push origin main'`

Pull the latest changes

`'git pull origin main'`

2. What is the difference between git fetch and git pull? Answer in 2 lines.

git fetch: downloads the latest changes from the remote repository but does not merge them into your current branch.

git pull: downloads the latest changes and automatically merges them into your current branch.

3. Create a new GitHub repository, push any small text file from your local system, and share the repo link.

`git init`

`git add sample.txt`

`git commit -m "First commit"`

`git branch -M main`

`git remote add origin https://github.com/Krishnapatel191/02-june.git`

`git push -u origin main`

4. What is the difference between a Fork and a Pull Request? Answer in 2 lines.

Fork: A Fork is a personal copy of someone else's repository that allows you to make changes independently.

Pull Request (PR): A Pull request is a request to merge your changes from a fork or branch into the original repository.

5. Create a new branch named feature-test, make one commit on it, and merge it back to the main branch. Write the commands you used.

```
git checkout -b feature-test  
echo "Test change" > test.txt  
git add test.txt  
git commit -m "Add test file"  
git checkout main  
git merge feature-test
```
